

› Service Oriented Architecture

Businesses are being forced to respond faster to competitive and customer challenges. They are looking to IT to provide flexibility and speed as they address complex business problems. Forced to deliver more in less time, IT managers are looking for technologies that provide agility and lower costs. Let Zanett show you how Service Oriented Architecture (SOA) can give you a competitive advantage.

› Simplify and Standardize

The concept of SOA is not new, but the popularity of web services and XML has made it a reality. Simply put, SOA facilitates the development of applications as modular business services that can be easily shared and integrated. Uses for SOA include:

SOA-based Integration

The typical integration strategy involves a significant number of point-to-point integrations. Many organizations underestimate the long-term cost of maintaining this type of complex, unstable ecosystem. SOA facilitates standards-based integrations, allowing applications to evolve cost effectively over time.

Modernizing Legacy Applications

Companies spend on average 70-80% of their IT budgets maintaining legacy applications, often on mainframes. Changes and enhancements are risky. Businesses are being forced to respond faster to competitive and customer challenges. They are looking to IT to provide flexibility and speed as they address complex business problems. Forced to deliver more in less time, IT managers are looking for technologies that provide agility and lower costs. Let Zanett show you how Service Oriented Architecture (SOA) can give you a competitive advantage. SOA allows the migration from legacy platforms, one service at a time, significantly reducing upgrade cycles.

Modern Application Development

Custom applications are important to many companies, but often become monoliths where integration was an afterthought. SOA offers a better way to design integrated, reusable assets.

› Don't maintain. Innovate.

Predict & Respond Quickly

Oracle SOA suite provides increased, real-time visibility into your business environment and allows you to develop and optimize processes rapidly.

Build a Cohesive Infrastructure

By simplifying your environment, you can provision, deploy, monitor, and manage it more effectively and efficiently.

Leverage Existing Investments

SOA makes your environment modular, open, and extensible. It can be adopted in an incremental fashion, allowing you to replace systems when you want.

"Zanett was instrumental in helping to build our service oriented architecture (SOA). This SOA enables us to integrate and leverage business logic running on multiple platforms, as well as consume data from third parties in a consistent manner."
